

Credit Name: CSE 2110 Procedural Programming 1
Assignment Name: DigitsDisplay

Understanding the Problem

How did you approach understanding the challenge?

I understood that the program wanted the user to input any positive number and display that number from the highest place to lowest digit place separately. The program also asked for the user to input a positive integer. Due to this, I knew that the code required a while loop statement to ensure that the user actually inputs a positive integer and not a negative. Furthermore, I realized that I needed to store the number somewhere

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

While I was creating my code, I was confused if I should use a do while statement or not. However I decided that I should use a do statement instead because I wanted the code to check the statement at least once to ensure that the user actually puts in a positive integer, and not a negative integer. I was able to figure this out by using my textbook that helped me figure out which one is best.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

I decided that for my code, I should work on prompting the user for inputs, so that it can help me better understand how to utilize the do-while statement and make sure it works properly. After I finished the outputs, I decided to work on the calculations that show the code.

How did you decide on the tools, data structures, or algorithms to use?

I knew that I had to use a while statement in my code for input validation to make sure that the code works properly. I also knew that I had to get input from the user so I used Scanner class.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

I wrote the code in small pieces and tested each small piece together. I did this to ensure that my code was working throughout. If I attempted to finish the code at once, it would not be efficient and effective in creating my code because if I had an error in my code, I might need to

change my entire code to fix that issue. As a result, I would spend more time creating my code than if I created it in smaller steps. Another reason why I created my code in smaller pieces is because then I can understand what the code is doing on a deeper level.

Overcoming Challenges

What part of the problem was the most difficult for you?

The part of the problem that was most difficult for this assignment was how I was going to display the code from the highest digit to lowest digit. I was able to solve this problem by creating more while loops in the code and making variables such as divisor and temp.

How did you handle moments when you felt stuck or unsure of what to do next?

Learning

Was there anything you learned that you think will help you with future challenges?

From this program, I realized that the textbook is a really good tool to make decisions between using a while loop or do-while loop. As I move forward, I will refer to the textbook more. I will also understand what type of while loop I should use as I create more applications that require them.
